

Can You Guess Which of These Guys DIDN'T Call into Work 'Sick' Today?

a. JIMBO

b. AFAD (Automated Flagger Assistance Device)

b. AFAD (Automated Flagger Assistance Device)

We're in the thick of the greatest labor crisis of our time and the thing in shortest supply is -- you guessed it -- "qualified" workers. As a traffic control company, BC CANNON has been helping our GCs and clients remedy this problem while keeping their workers safe through the use of AFADs on their jobsites.

01.

What is an AFAD?

An AFAD is a portable flagging station that removes the traditional human flagger from the road while providing motorists with clear guidance through a work site/temporary traffic control zone.

02.

Are AFADs DOT legal??

Wanco® AFADs are MUTCD approved and meet DOT spec criteria/qualified products standards for SC, TN, NC and most other states.

03.

Will AFADs save me from having to use human flaggers?

You will still need human flaggers, BUT not as many. Reduced labor leads to reduced expenses, headaches and risk. Many state DOT specs, like South Carolina's, require two flagger-certified workers to operate AFADs on a public road, but the standards differ by state.

04.

Will AFADs improve safety?

YES! AFADs help keep your workers safe by allowing flagging operations to be conducted from the side of the roadway vs. the travel lane.

05.

What is involved with the setup & maintenance of AFADs?

Setup is simple and takes just a few minutes thanks to the easy-to-use, touch screen color controllers. Dual-tow and tandem-tow options make transporting and deploying AFADs a breeze. Wanco® AFADs are battery powered, solar assisted. The trailers will run autonomous year round. The controllers have an industry leading 60 hour battery life. Additionally, there are charging stations on each unit for the controllers, which helps eliminate downtime on the jobsite.

06.

How do I know if I need AFADs?

Simple! Just ask yourself two questions:

- 1) With driving fatalities and accidents at an all-time high, would your workers benefit from a device that allows them to flag traffic efficiently and out of harms way?
- 2) Would you like to save money on your traffic control costs and overall project budget? The math is easy:

FLAGGER COST
(Flagger Day Rate x # of Project Days)

vs.

AFAD COST
(Purchase or Rent)
